

Study on different sampling methods for Structural Business Survey at the municipal level

Liljana Boçi

Institute of Statistics Albania

Abstract

This is a study on SBS-Survey, one of the main surveys of the national statistical program of Albania. The main objective of it is to suggest improvements on the sample design of SBS with the aim to use it on level of municipalities. The hypotheses included in this study are based on empirical analysis, where the information used is limited, compared to the traditional method used in the business structural survey. Suggestions for alternative, indirect methods are well provided and are suggested to be used on the future.

Keywords: Target Group, Stratification, Frame, Neyman allocation, Exhaustive, Accuracy level, Publication domain, Systematic selection, Reweighting, Implicit, Explicit.
